Creating wireframes

Web-development I. course

What is wireframe?

- A wireframe is a layout of a web page that demonstrates what interface elements will exist on key pages. It is a critical part of the interaction design process.

Advantages of Wireframing

- It provides an early visual that can be used to review with the client.
- Users can also review it as an early feedback mechanism for prototype usability tests.
- From a practical perspective, the wireframes ensure the page content and functionality are positioned correctly based on user and business needs.
- And as the project moves forward they can be used as a good dialogue between members of the project team to agree on the project vision and scope.

Disadvantages of Wireframing

- It is not always easy for the client to grasp the concept.
- The designer will also have to translate the wireframes into a design, so communication to support the wireframe is often needed to explain why page elements are positioned as they are.
- Also, when content is added, it might initially be too much to fit within the wireframe layout, so the designer and copywriter will need to work closely to make this fit.

Step 4: Setting a Grid, Determine Layout With Boxes

- Start by drawing boxes on the grid. Think about the order of information you would like to present to your visitors, top to bottom is the easiest, followed by left to right.

Step 5: Define Information Hierarchy With Typography

Advertising opportunities

Helping clients with their communities gives us the occasional opportunity to match up advertisers and available space. [Click here to view the inventory we are currently helping to fill.](#)

FAQ

Q: What's the difference between a web community and an online forum?
A: This is the most common question we run into with our clients. As we consult with them about their needs, they'll often say, "Oh, we already have a forum, so I guess that's our community." ...[see full answer](#)
