Refreshing

Specification

Components:

- **Input data** (identifier, set of values [unit of measure])
- Information about the input (**precondition**)
- **Output**, results (identifier, set of values)
- The statement – true for all input and output – used to get the result (**postcondition**)
- Definitions of the used concepts
- Requirements against the solution
- Restricting conditions

The algorithm

Elements of the algorithms:

- Sequence (step by step execution)
- Conditional branch (choice from 2 or more options based on a condition)
- Loop (repeat certain amount of times or until a certain condition is met)
- Subprogram (a complex activity, with a unique name – abstraction)

Programming on **analogous*** **way**

* similar

Problem solving in analogous way

- When you need to solve a problem - earlier you solved a similar problem → you can solve it based on the previous solved problem.
- General problem-solving method:
 - practical experience, learned knowledge
 - in all filed, domains of life
 - also in the toolbox of a practising programmer

Problem solving in analogous way

- Examples
 - planting,
 - cooking,
 - assembling,
 - ...

Problem solving in analogous way

- **Aim:** create a program (algorithm) to solving a problem

every time find out the solution

or

find a similar problem and use the solution as a basis

Programming in analogous way: the solution of a specific problem is based on the solution to a previous problem.

Problem solving in analogous way

Analogous programming – algorithmic thinking

"sample problem"

"specific problem"

specification

specification

algorithm

algorithm

code

Problems similar to the sample problem are solved by using, copying the ideas from the sample task, using analogous algorithmic thinking.

Analogous programming – reduction

"sample problem"

"specific problem"

↓
code

In reduction, we use the sample algorithm as a *template* to produce an algorithm that solves the specific problem, checking the differences between the specification of the specific and the sample problem.

Analogous programming – reduction

- In reduction, we use the algorithm of the sample problem as a **template** to produce an algorithm that solves the specific problem, checking the **differences** between the **specification** of the specific and the sample problem.
- If the correctness of the template (pattern) is proofed - the reduction don't change the correctness -> the specific problem will be solved correct...

Example problem

- A paper collection is organised in a secondary school. We know how many kilos of paper each student collected. Find out how much paper was collected in total?

example:

$[1, 3, 2, 0, 5, 2] \rightarrow 13$

example:

$n=6, \text{kg}=[1, 3, 2, 0, 5, 2] \rightarrow \text{total}=13$

	kg
1	1
2	3
3	2
4	0
5	5
n=6	2
total= 13	

Example problem

Task: calculate the sum of the elements of an array with n numbers

Specification:

In: $n \in \mathbb{N}$, $kg \in \mathbb{N}[1..n]$

Out: $s \in \mathbb{N}$

Pre: -

Post: $s = \text{SUM}(i=1..n, kg[i])$

Algorithm:

$s := 0$
$i = 1..n$
$s := s + kg[i]$

example:

$n=6, kg=[1, 3, 2, 0, 5, 2] \rightarrow \text{total}=13$

	kg
1	1
2	3
3	2
4	0
5	5
n=6	2
total= 13	

$$s = \sum_{i=1}^n kg[i]$$

Example₂ – scalar product

Task:

Calculate the scalar product of two vectors with the same dimension

example:

$n=3$,

$x=[1, -3, 2]$, $\rightarrow s = -9$

$y=[4, 5, 1]$

	x	y	$x[i]*y[i]$
1	1	4	4
2	-3	5	-15
n=3	2	1	2
			s= -9

Example₂ – scalar product

Task:

Calculate the scalar product of two vectors with the same dimension

Specification:

In: $n \in \mathbb{N}$, $x \in \mathbb{Z}[1..n]$, $y \in \mathbb{Z}[1..n]$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, x[i]*y[i])$

	x	y	x[i]*y[i]
1	1	4	4
2	-3	5	-15
n=3	2	1	2
			s= -9

$$s = \sum_{i=1}^n x[i] * y[i]$$

Example₂ – scalar product

collecting paper:

In: $n \in \mathbb{N}$, $kg \in \mathbb{N}[1..n]$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, kg[i])$

scalar product:

In: $n \in \mathbb{N}$, $x \in \mathbb{Z}[1..n]$, $y \in \mathbb{Z}[1..n]$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, x[i]*y[i])$

Comparing the specification $\rightarrow$ the 2 problems are similar

Let's create the algorithm using

- analogous algorithmic thinking
- reduction

Example₂ – scalar product

analogous algorithmic thinking

collecting paper:

During the solution we calculate the sum continuously.

We use an integer variable (i) to index all of the elements in the array and add the kg[i] referenced value to the sum (started with a 0 value) => The algorithm is a value assignment, then in a loop from 1 to n.

scalar product:

During the solution we calculate the sum continuously.

We use an integer variable (i) to index all of the elements in the arrays and add the x[i]*y[i] referenced value to the sum (started with a 0 value) => The algorithm is a value assignment, then in a loop from 1 to n.

Example₂ – scalar product reduction

collecting paper:

In: $n \in \mathbb{N}$, $kg \in \mathbb{N}[1..n]$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, kg[i])$

scalar product:

In: $n \in \mathbb{N}$, $x \in \mathbb{Z}[1..n]$, $y \in \mathbb{Z}[1..n]$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, x[i]*y[i])$

Algorithm

$s \sim s$
 $kg[i] \sim x[i]*y[i]$

Example₃ – sum of numbers

example:

$n=1, m=5 \rightarrow s=15$

$n=-2, m=2 \rightarrow s=0$

Task:

Calculate the sum all of the integers between the two integers a and b ($a \leq b$)!

Specification:

In: $n \in \mathbb{Z}, m \in \mathbb{Z}$

Out: $s \in \mathbb{Z}$

Pre: $n \leq m$

Post: $s = \text{SUM}(i=n..m, i)$

$$s = \sum_{i=n}^m i$$

n=	-2
	-1
	0
	1
m=	2
s=	0

Example₃ – sum of numbers

collecting paper:

In: $n \in \mathbb{N}$, $kg \in \mathbb{N}[1..n]$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, kg[i])$

sum of numbers:

In: $n \in \mathbb{Z}$, $m \in \mathbb{Z}$

Out: $s \in \mathbb{Z}$

Pre: $n \leq m$

Post: $s = \text{SUM}(i=n..m, i)$

Comparing the specification $\rightarrow$ the 2 problems are similar

Let's create the algorithm using

- ~~analogous algorithmic thinking~~
- reduction

Example₃ – sum of numbers

reduction

collecting paper:

In: $n \in \mathbb{N}$, $kg \in \mathbb{N}[1..n]$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, kg[i])$

sum of numbers:

In: $n \in \mathbb{Z}$, $m \in \mathbb{Z}$

Out: $s \in \mathbb{Z}$

Pre: $a \leq b$

Post: $s = \text{SUM}(i=n..m, i)$

Algorithm

$s \sim s$
 $1..n \sim n..m$
 $kg[i] \sim i$

Conclusion

- The problems (tasks) are similar – they can be solved using a template
- How can they be classified under the same template?
- How could such tasks be formulated in general?

Similarities

closed interval of numbers - loop

collecting paper

$s = \text{SUM}(i=1..n, \text{kg}[i])$

scalar product

$s = \text{SUM}(i=1..n, x[i]*y[i])$

	1	→	0
e=	2	→	5

s

Problem in general

Let an interval of integers $[b..e]$ and a function $f: [b..e] \rightarrow H$ be given. (Let us suppose that the addition operation is defined on the elements of H).

Determine the sum of the values of the f function on the interval $[b..e]$, i.e. the value of the expression $f(b)+f(b+1)+\dots+f(e)$

i		$f(i)$
b	$\rightarrow$	$f(b)$
$b+1$	$\rightarrow$	$f(b+1)$
$\dots$	$\rightarrow$	$\dots$
$e-1$	$\rightarrow$	$f(e-1)$
e	$\rightarrow$	$f(e)$

Problem in general

Specification:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $s \in \mathbb{H}$

Pre: -

Post: $s = \text{SUM}(i=b..e, f(i))$

i		f(i)
b	→	1
b+1	→	3
...	→	2
e-1	→	0
e	→	5

Algorithm:

During the solution we calculate the sum continuously.

We use an integer variable (i) to index all of the **elements in the interval** and add the **$f(i)$** referenced value to the **sum** (started with a 0 value) => The algorithm is a value assignment, then in a loop from b to e .

Example problem

Task: calculate the sum of the elements of an array with n numbers

example:
 $n=6, \text{kg}=[1, 3, 2, 0, 5, 2] \rightarrow \text{total}=13$

Specification:

In: $n \in \mathbb{N}, \text{kg} \in \mathbb{N}[1..n]$

Out: $s \in \mathbb{N}$

Pre: -

Post: $s = \text{SUM}(i=1..n, \text{kg}[i])$

	kg
1	1
2	3
3	2
4	0
5	5
n=6	2
total= 13	

Example – with reduction

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $s \in \mathbb{H}$

Pre: -

Post: $s = \text{SUM}(i=b..e, f(i))$

collecting paper:

In: $n \in \mathbb{N}, kg \in \mathbb{N}[1..n]$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, kg[i])$

Reduction:

s	$\sim$	s
$b..e$	$\sim$	$1..n$
$f(i)$	$\sim$	$kg[i]$

Algorithm:

Programming patterns

Kind of problems

- Program can be created ad-hoc
- There are strategies, solutions that can solve very similar problems – with small modifications
- Kind of problems → templates
- Let create a CORRECT solution (template)
- Analogous programming: we use those templates as **PATTERNS**

Programming pattern

Its aim:

- A proven template as a basis, on which we can build our solutions later. (Development will be quicker and safer)

Its structure:

1. abstract task specification [+program specification]
2. abstract algorithm

Comment: the input is at least a sequence...

Programming pattern (PoA)

How we use them:

1. create a specification for the given, specific task
2. guess the PoA from specification
3. "map" the parameters of the given task to the parameters of the corresponding abstract task = reduction
4. "generate" the task-specific algorithm based on the algorithm of the PoA, by changing the parameters as per point 3.
5. create a more efficient algorithm using program transformations

Programming patterns

Summation

Summation

Tasks (examples):

1. We know the monthly income and expenses of a person. Let's calculate by **how much** money his asset will change by the end of the year!
2. We know the lap times of a car racer. Let's determine his **average** lap time!
3. Let's calculate the **factorial** of N !
4. We know N words. Give the sentence we get by **joining** them.

Summation

Tasks (examples):

1. We know the monthly income and expenses of a person. Let's calculate by **how much** money his asset will change by the end of a year!
2. We know the time of a race and the speed of a racer. Let's determine the distance.
3. Let's calculate the sum of the first n natural numbers.
4. We know N sentences. Give the sentence we get by **joining** them.

What is common?
Calculate the sum of n numbers

Summation

Let an **interval** of integers $[b..e]$ and a **function** $f: [b..e] \rightarrow H$ be given. Let us suppose that the addition operation is defined on the elements of H .

Determine the **sum** of the values of the f function on the interval $[b..e]$, i.e. the value of the expression $\sum_{i=b}^e f(i)$ (if $b > e$ the value will be 0)

Specification:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $s \in H$

Pre: -

Post: $s = \text{SUM}(i=b..e, f(i))$

Algorithm:

Example

We know the monthly income and expenses of a person.
Let's calculate by how much money his asset will change by the end of the year!

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $s \in \mathbb{H}$

Pre: -

Post: $s = \text{SUM}(i=b..e, f(i))$

Specific problem:

In: $n \in \mathbb{N}, m \in \text{Tass}[1..n]$

$\text{Tass} = \text{In} \times \text{Exp}, \text{In} = \mathbb{N}, \text{Exp} = \mathbb{N}$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, m[i].\text{in} - m[i].\text{exp})$

Reduction:

s	$\sim$	s
$b..e$	$\sim$	$1..n$
$f(i)$	$\sim$	$m[i].\text{in} - m[i].\text{exp}$

Example

We know the monthly income and expenses of a person.
Let's calculate by how much money his asset will change by
the end of the year!

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $s \in \mathbb{H}$

Pre: -

Post: $s = \text{SUM}(i=b..e, f(i))$

Specific problem:

In: $n \in \mathbb{N}, m \in \text{Tass}[1..n]$

$\text{Tass} = \text{In} \times \text{Exp}, \text{In} = \mathbb{N}, \text{Exp} = \mathbb{N}$

Out: $s \in \mathbb{Z}$

Pre: -

Post: $s = \text{SUM}(i=1..n, m[i].\text{in} - m[i].\text{exp})$

Reduction:

s	$\sim$	s
$b..e$	$\sim$	$1..n$
$f(i)$	$\sim$	$m[i].\text{in} - m[i].\text{exp}$

Algorithm:

Programming patterns

Counting

Counting

Tasks (examples):

1. We know the monthly income and expenses of a person. Let's count **the number of months** where his assets grow!
2. Let's calculate the **number of** divisors of an integer!
3. Let's determine **how many** letter "a" can be found in the name of a person!
4. Based on the annual daily statistics, let's count the **number of** days when frozen!
5. We have birth date (month) data from N people. Let's count **how many** of them have birthday during the winter!

Counting

Tasks (examples):

1. We know the monthly income and expenses of a person. Let's count **the number of months** when his assets grow!
2. Let's calculate the **number of months** when the person's income is higher than his expenses.
3. Let's determine the **number of months** when the person's income is higher than his expenses.
4. Based on the data, let's count the **number of months** when the person's income is higher than his expenses.
5. We have a sequence of "somethings", and we have to count how many of their items have a given attribute.

Counting – example

algorithmic thinking

Task: Let's determine how many letter "a" can be found in the name of a person!

Specification:

In: $\text{name} \in S$

Out: $\text{cnt} \in \mathbb{N}$

Pre: -

Post: $\text{cnt} = \text{SUM}(i=1..length(\text{name}), 1, \text{name}[i] = \text{"a"})$

i	name	name[i]="a"	value
1	a	true	1
2	r	false	0
3	i	false	0
4	a	true	1
cnt=			2

Algorithm:

Counting

count how many of their items have a given attribute

Let an **interval** of integers $[b..e]$ and a **condition** $A: [b..e] \rightarrow L$ be given.

Determine the **number of times** A attains the "true" value on the interval $[b..e]$ (in the case of an empty interval, if $b > e$ the value returned will be 0)

Specification:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $cnt \in \mathbb{N}$

Pre: -

Post: $cnt = \text{SUM}(i=b..e, 1, A(i))$

shorting:

Post: $cnt = \text{COUNT}(i=b..e, A(i))$

Algorithm:

Example

We have birth date (month) data from N people. Let's count how many of them have birthday during the winter!

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $cnt \in \mathbb{N}$

Pre: -

Post: $cnt = \text{COUNT}(i=b..e, f(i))$

Specific problem:

In: $n \in \mathbb{N}, m \in \mathbb{N}[1..n]$

Out: $cnt \in \mathbb{Z}$

Pre: $\forall i \in [1..n]: (1 \leq m[i] \leq 12)$

Post: $cnt = \text{COUNT}(i=1..n, m[i] < 3 \text{ or } m[i] = 12)$

Reduction:

cnt	$\sim$	cnt
$b..e$	$\sim$	$1..n$
$A(i)$	$\sim$	$m[i] < 3 \text{ or } m[i] = 12$

the precondition of the specific problem
can be stricter than in the used pattern

Example

We have birth date (month) data from N people. Let's count how many of them have birthday during the winter!

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $\text{cnt} \in \mathbb{N}$

Pre: -

Post: $\text{cnt} = \text{COUNT}(i=b..e, f(i))$

Specific problem:

In: $n \in \mathbb{N}, m \in \mathbb{N}[1..n]$

Out: $\text{cnt} \in \mathbb{Z}$

Pre: $\forall i \in [1..n]: (1 \leq m[i] \leq 12)$

Post: $\text{cnt} = \text{COUNT}(i=1..n, m[i] < 3 \text{ or } m[i] = 12)$

Reduction:

cnt	$\sim$	cnt
$b..e$	$\sim$	$1..n$
$A(i)$	$\sim$	$m[i] < 3 \text{ or } m[i] = 12$

Algorithm

Example

We have birth date (month) data from N people. Let's count how many of them have birthday during the winter!

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $\text{cnt} \in \mathbb{N}$

Pre: -

Post: $\text{cnt} = \text{COUNT}(i=b..e,$

What would happen if the precondition was not met?

Specific problem:

In: $n \in \mathbb{N}, m \in \mathbb{N}[1..n]$

Out: $\text{cnt} \in \mathbb{Z}$

Pre: $\forall i \in [1..n]: (1 \leq m[i] \leq 12)$

Reduction:

cnt	$\sim$	cnt
$b..e$	$\sim$	$1..n$
$A(i)$	$\sim$	$m[i] < 3 \text{ or } m[i] = 12$

Algorithm

Programming patterns

Maximum selection

Maximum selection

Tasks (examples):

1. We know the monthly income and expenses of a person. Let's determine the month where his assets grow the **most**!
2. Let's pick the name of the person who is the **last** in the alphabetical order!
3. Let's find the person, who likes the **most** types of food!
4. Based on the annual daily statistics, let's define the **warmest** day during the year!
5. We have birth dates from N people, let's find who has birthday in the year **first**!

Maximum selection

Tasks (examples):

1. We know

What is common?

We have to pick/find the greatest (or least) something from a sequence of "somethings".

Important:

The somethings have an attribute based on which we can sort them (sorting relation).

4. If we have at least 1 element, then we know that there exists a maximum (or minimum).

5. From N people, let's find who has the year **first!**

Maximum selection – example

algorithmic thinking

Task: Based on the annual daily statistics, let's define the **warmest** day during the year!

Specification:

In: $n \in \mathbb{N}$, $\text{temp} \in \mathbb{R}[1..n]$

Out: $\text{day} \in \mathbb{N}$

Pre: $n > 0$ and $\forall i \in [1..n]: (-100 \leq \text{temp}[i] \leq 100)$

Post: $\text{day} \in [1..n]$ and $\forall i \in [1..n]: (\text{temp}[\text{day}] \geq \text{temp}[i])$

i	temp	day (i=1)	day (i=2)	day (i=3)	day (i=4)
1	13,5	13,5	13,5	13,5	13,5
2	12,6	12,6	12,6	12,6	12,6
3	14,8	14,8	14,8	14,8	14,8
4	10,2	10,2	10,2	10,2	10,2

Algorithm:

Maximum selection

Let a non-empty **interval** of integers $[b..e]$ and a **function** $f: [b..e] \rightarrow H$ be given. Let us suppose that a total order is defined on the elements of H .

Determine the **point (index)** at which attains its maximum value on the interval $[b..e]$ and calculate this **value** too. (if there is more than one maximum, any of them can be selected)

Specification:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $\text{maxind} \in \mathbb{Z}, \text{maxval} \in H$

Pre: $b \leq e$

Post: $\text{maxind} \in [e..u]$ and

$\forall i \in [b..e]: (f(\text{maxind}) \geq f(i))$ and

$\text{maxval} = f(\text{maxind})$

Maximum selection

Let a non-empty **interval** of integers $[b..e]$ and a **function** $f: [b..e] \rightarrow H$ be given.
Let us suppose that a total order is defined on the elements of H .

Determine the **point (index)** at which attains its maximum value on the interval $[b..e]$ and calculate this **value** too. (if there is more than one maximum, any of them can be selected)

Specification:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $\text{maxind} \in \mathbb{Z}, \text{maxval} \in H$

Pre: $b \leq e$

Post: $\text{maxind} \in [b..e]$ and
 $\forall i \in [b..e]: (f(\text{maxind}) \geq f(i))$ and
 $\text{maxval} = f(\text{maxind})$

shorting:

Post:

$(\text{maxind}, \text{maxval}) = \text{MAX}(i = b..e, f(i))$

Algorithm:

Example

Let's pick the name of the person who is the last in the alphabetical order!

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Selection

Selection

Tasks (examples):

1. We know the monthly income and expenses of a person. His assets grow by the end of the year. Let's **give** a month, **when** his asset grows!
2. Let's **define** the least divisor of a non-1 integer!
3. Let's **find** a vowel in an English word!
4. Let's **define** the serial number of a month given by its name!

Selection

Tasks (examples):

1. We know the names of the persons

What is common?

2. We have a sequence of "somethings", and we have to select an element that has a given attribute, and we know that at least one such element exists in the sequence.

3. A "narrowed" (input) version of search

4. ... of a month given

Selection – example

algorithmic thinking

Task: Let's **define** the least divisor of a non-1 integer

Specification:

In: $n \in \mathbb{N}$

Out: $d \in \mathbb{N}$

Pre: $n > 1$

Post:

$1 < d \leq n$ and $d \mid n$ and
 $\forall i \in [2..d-1]: (i \nmid n)$

i	$i \leq 9?$	$i \nmid 9?$
1		
e= 2	true	true
3	true	false
4		
5		
6		
7		
8		
n= 9		

i	$i \leq 5?$	$i \nmid 5?$
1		
e= 2	true	true
3	true	true
4	true	true
n= 5	true	false

Algorithm:

$i := 2$
$\text{not}(i \mid n)$
$i := i + 1$
$d := i$

Selection

Let an **interval** of integers $[b..e]$ and a **condition** $A: [b..e] \rightarrow L$ be given.

Determine the **leftmost point** starting with b at which A attains the "true" value on the interval $[b..e]$ if we know that such point definitely exists

Specification:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $ind \in \mathbb{Z}$

Pre: $\exists i \in [b..e]: (A(i))$

Post: $ind \geq b$ and $A(ind)$ and
 $\forall i \in [b..ind-1]: (\text{not } A(i))$

shorting:

Post: $ind = \text{SELECT}(i=b..e, A(i))$

Example

Let's find a vowel in an English word!

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $ind \in \mathbb{Z}$

Pre: $\exists i \in [b..e] : (A(i))$

Post: $ind = \text{SELECT}(i=b..e, A(i))$

Specific problem:

In: $word \in S$

Out: $vind \in \mathbb{N}$

Pre: $\exists i \in [1..length(word)] : (isvowel(word[i]))$

Post: $vind = \text{SELECT}(i=1..n, isvowel(word[i]))$

Reduction:

ind	$\sim$	$vind$
$b..e$	$\sim$	$1..n$
$A(i)$	$\sim$	$isvowel(word[i])$

A attribute function

Algorithm

```
ind := b
while not A(ind)
  ind := ind + 1
```

```
vind := 1
while not isvowel(vind)
  vind := vind + 1
```

Example

Let's find a vowel in an English word!

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $ind \in \mathbb{Z}$

Pre: $\exists i \in [b..e] : (A(i))$

Post: $ind = \text{SELECT}(i = b..e, A(i))$

Specific problem:

In: $word \in S$

Out: $vind \in \mathbb{N}$

Func: $isvowel: C \rightarrow L$

$isvowel(ch) = (ch = 'a' \text{ or } ch = 'e' \text{ or } \dots)$

Pre: $\exists i \in [1..length(word)] : (isvowel(word[i]))$

Post: $vind = \text{SELECT}(i = 1..n, isvowel(word[i]))$

Out: $\text{cnt} \in \mathbb{N}, y \in H[1..\text{cnt}]$

Pre: -

Post: $\text{cnt} = \text{COUNT}(i=b..e, A(i))$ and
 $\forall i \in [1..\text{cnt}]: (\exists j \in [b..e]: A(j) \text{ and } y[i] = f(j))$
and $y \subseteq (f(b), f(b+1), \dots, f(e))$

shorting:

Post: $(\text{cnt}, y) = \text{MIS}(i=b..e, A(i), f(i))$

f and A assign to the same element!

Multiple item selection

i		A(i)		f(i)
b	→	false		
b+1	→	true	→ 1	f(b+1)
b+2	→	true	→ 2	f(b+2)
e	→	false		

Let an **interval** of integers $[b..e]$, a **condition** $A: [b..e] \rightarrow L$ and a **function** $f: [b..e] \rightarrow H$ be given.

Determine the **f values** of the **point(s)** at which **A** attains the "true" value on the interval $[b..e]$

Specification:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $\text{cnt} \in \mathbb{N}, y \in H[1..\text{cnt}]$

Pre: -

Post: $(\text{cnt}, y) = \text{MIS}(i=b..e, A(i), f(i))$

Example

Let's calculate the divisors of an integer!

Pattern:

In: $b \in \mathbb{Z}, e \in \mathbb{Z}$

Out: $\text{cnt} \in \mathbb{N}, y \in \mathbb{H}[1..\text{cnt}]$

Pre: -

Post: $(\text{cnt}, y) = \text{MIS}(i = b..e, A(i), f(i))$

Specific problem:

In: $n \in \mathbb{N}$

Out: $\text{cnt} \in \mathbb{N}, \text{divs} \in \mathbb{H}[1..\text{cnt}]$

Pre: -

Post: $(\text{cnt}, \text{divs}) = \text{MIS}(i = 1..n, i | n, i)$

Reduction:

cnt, y	$\sim$	cnt, divs
$b..e$	$\sim$	$1..n$
$A(i)$		$i n$
$f(i)$	$\sim$	i

Algorithm

Programming patterns **conclusions**

Programming patterns

1. Summation
2. Counting
3. Maximum selection
4. Copy
5. Multiple item selection
